

Deck Preview User's Guide

`index.html` is a local browser tool for reviewing the 100 Lunar Field Cards before print. It reads the same `data/` and `css/card.css` the print build uses, so what you see is what the card is.

Starting it

```
./start_webserver.sh          # serves the folder on http://localhost:8002
```

Open <http://localhost:8002> in a browser. Nothing is written to disk; it is a viewer only.

The header bar

Control	What it does
◀ / ▶	Previous / next card within the selected pill (see the grouping strip below). Wraps at the ends of that pill's list.
number box	Jump to a card by its L-number. It is scoped to the selected pill: its min/max track the pill, and a number outside the pill snaps to the nearest L that is in it.
L n · Name	The current card's L-number and feature name.
meta	Zone · category · difficulty seed · status dot (stub / draft / review / final).
Both / Front / Back	Show both faces side by side, or just one.

The grouping strip

Under the header is a row of **pills** and a `Num · Color · Phase` toggle that chooses what the pills mean. Whatever pill is active defines the list the ◀ ▶ arrows, the arrow keys and the number box walk. Click a pill to jump to its first card. The current card's pill is always the highlighted (orange) one; below the pills, a second row of small buttons is the **card strip** for that pill, each with its status dot — click one to go straight to that card.

Num — by decade

Ten pills, 1–10 ... 91–100. Wood ordered the Lunar 100 by roughly increasing difficulty, so each decade is a difficulty band; the pills are tinted along the same green → amber → rust ramp as the difficulty slider on the back of a card.

Color — by lunar zone

Four pills, one per zone, each in that zone's own colour:

Zone	Colour
Eastern Rim	steel blue
Eastern Heartland	forest green
Western Heartland	light red
Western Rim	light yellow

Selecting a zone pill filters the strip to that zone's cards. The three concept cards (L1–L3) have no zone; in Color mode they fall back to the Eastern Rim strip.

Phase — by Moon phase

Seven pills labelled with the Moon-phase glyphs:

Glyph	Phase	Lunar age (days)
	Waxing Crescent	0–7
	First Quarter	7–11
	Waxing Gibbous	11–15
	Full	15–18
	Waning Gibbous	18–22
	Last Quarter	22–26
	Waning Crescent	26–30

Each card is placed by its **best-days** windows (lunar age), so a card with a sunrise window and a sunset window shows up under two pills and the pill counts add up to more than 100. New Moon is dropped — there is nothing to observe — and those days fold into the  pill.

A **caption** between the pills and the strip names the selected phase and its day range, e.g. WAXING GIBBOUS · DAY 11–15 .

The Tonight switch

In Phase mode a Tonight  button sits after the glyph pills. It works out tonight's Moon age from the current date and, when toggled on:

- greys out every phase pill except tonight's,
- gives tonight's pill an accent ring and jumps the strip to it,

- adds `· TONIGHT` to the caption.

Toggle it off, click any other phase pill, or leave Phase mode to return to the normal view. It is a quick "what's well placed for me right now" filter.

Enlarging an image

Click any card image — the locator panel, the close-up, or the small "Another view" inset — to open it full size in a lightbox. Click the image again to toggle 1:1 (actual pixels) versus fit-to-window. Click the backdrop, the X, or press **Esc** to close.

Keyboard shortcuts

Key	Action
← / →	Previous / next card in the selected pill
F	Front only
B	Back only
D	Both faces
Esc	Close the lightbox

Deep links

The URL hash tracks the current card: `.../index.html#L42` opens straight to L42, and the app keeps the hash updated as you move, so a link always points at the card you were on.
